Abstract

Write later

Keywords: K-REACH; genotoxicity; in silico; QSAR; structural alerts; machine learning

1 Introduction

Genotoxicity is a critical toxicological endpoint that assesses the potential of chemicals to induce DNA damage, mutations, or carcinogenesis and plays a central role in regulatory chemical evaluation ([Karamertzanis et al. 2025](#); [Hayashi 2022](#); [EFSA Scientific Committee 2018](#)).
